

Enterprise Mobility Management

A professionally structured UX case study for managing users, devices, policies, enrollments, geofences and security operations.

Core challenge Reduce IT administration complexity while improving security, visibility and compliance.	Primary audience Enterprise IT administrators, mobility managers, security teams and employees.
Design approach Desktop-first enterprise SaaS with strong hierarchy, automation and safe actions.	Portfolio story Users → Groups → Devices → Policies → Geofences → Compliance.

Portfolio positioning: Senior / Lead UI/UX Designer case study demonstrating complex workflows, information architecture, interaction design and enterprise usability.

01 · Enterprise EMM Case Study

Centralized endpoint administration becomes one operational workspace. The administrator can understand fleet health, investigate risk, take controlled action and verify results.

Area	UX focus
Problem	Fragmented tools, large device fleets, policy conflicts and slow incident response.
Goal	Give administrators a single source of truth for identity, endpoints, policies, location and compliance.
Success	Faster enrollment, faster remediation, fewer errors, higher task success and stronger auditability.

02 · Personas

Arjun Rao · IT Administrator

35 · Enterprise IT Administrator · 2,000+ employees.
Goals: manage fleets, maintain security, resolve non-compliance and automate repetitive work.

Priya Sharma · Employee

29 · Sales Manager. Goals: enroll quickly, access corporate apps and understand security requirements.

Admin pain points

Too many devices, unclear policy violations, fragmented visibility, complicated enrollment and delayed alerts.

Employee pain points

Long setup, confusing security rules, unexpected restrictions and weak error messages.

03 · Empathy Map

Says "Show me what needs attention." "Which policy caused this?" "Can I resolve this for many devices?"	Thinks "Is this device really at risk?" "Will policies conflict?" "What will this action affect?"
Does Filters devices, checks alerts, assigns policies, reviews compliance, performs remote actions and audits changes.	Feels Time pressure during incidents; cautious before destructive actions; confident when the UI explains cause and impact.

Key insight: the administrator needs **confidence before action**. Status should be paired with cause, scope, impact and next best action.

04 · Information Architecture

Navigation	Key content
Dashboard	KPIs · compliance · alerts · recent activity
Users	All users · groups · roles · user detail
Devices	All devices · groups · compliance · remote actions
Enrollments	Pending · completed · failed · enrollment methods
Policies	Security · device · application · network · compliance
Geofences	Map · active · inactive · location rules
Applications	Required · blocked · managed applications
Reports	Device · compliance · enrollment · policy
Alerts / Audit Logs	Security alerts · activity history · audit trail
Settings	Organization · integrations · permissions

05 · User Journey

Stage	Goal	Emotion	UX opportunity
Monitor	Understand fleet health	Focused	Prioritize anomalies
Investigate	Identify cause	Concerned	Connect device → rule → policy
Decide	Choose safe action	Cautious	Show impact and scope
Act	Apply remediation	Confident	Show progress
Verify	Confirm resolution	Relieved	Re-check compliance
Learn	Prevent recurrence	Analytical	Reports and audit history

06 · User Flows

User management Login → Users → Search → User detail → Group → Policy → Confirm → Success	Device management Dashboard → Devices → Filter → Device detail → Security / Location → Action → Confirmation
Policy management Policies → Create → Category → Rules → Target → Review → Publish → Compliance	Enrollment Enrollments → Method → QR / Invitation → Authentication → Configuration → Policy → Compliance
Geofence Geofences → Create → Location → Boundary → Entry/exit actions → Assign → Activate	Non-compliance Dashboard → Alert → Device → Failed rule → Remediation → Re-check → Resolve

07 · Task Flows

Task	Flow
Add user	Users → Add user → Information → Department → Group → Policy → Review → Create
Enroll device	Enrollments → Create → Method → QR → Authenticate → Register → Configure → Compliance
Create policy	Policies → Create → Security → Rules → Assign → Review → Publish
Create geofence	Geofences → Create → Name → Location → Radius / polygon → Actions → Assign → Activate
Resolve issue	Alert → Device → Failed rule → Sync → User remediation → Re-check → Close

08 · Users

List Search, filter, sort and bulk actions. Show status, department, role, devices and policy.	Detail Profile, groups, devices, enrollment history, policies, compliance and activity.
Actions Disable, delete, assign group and assign policy with appropriate permissions and confirmation.	

09 · Devices

Overview Owner, model, OS, serial, IMEI, enrollment date and last seen.	Security Encryption, passcode, integrity, compliance and failed rules.
Remote actions Sync, lock, notify, restart and wipe; destructive actions require strong confirmation.	Location & apps Last known location, history, installed apps and assigned controls.

10 · Policies

Layer	Examples	UX requirement
Security	Password, encryption, screen lock	Simple rules and clear defaults
Device	Camera, USB, Bluetooth	Explain impact and platform support
Application	Required / blocked apps	Show scope and conflicts
Network	Wi-Fi, VPN, proxy	Preview before publish
Compliance	OS, encryption, integrity	Show failed rule and remediation

Lifecycle: Draft → Review → Publish → Deploy → Monitor → Version → Roll back / Disable.

11 · Enrollments

Methods QR code, email invitation, manual, bulk import and automated enrollment.	States Pending → Initiated → In progress → Completed; Failed and Expired are recoverable.
Employee UX Short instructions, visible progress, permission explanations and actionable errors.	Admin UX Enrollment funnel, failure tracking, resend invitation and automatic policy assignment.

12 · Geofences

Create Name → Search location → Draw radius / polygon → Preview.	Assign Users, groups or devices.
Entry Apply corporate Wi-Fi, allow required apps or activate location policy.	Exit Apply remote-work policy, revoke location access or notify administrators.
States Draft, Active and Inactive with visible scope and activity.	

13 · Lost / Stolen Device Flow

Step	Admin experience	UX principle
1 Detect	Employee report or security alert	Fast access
2 Verify	Owner, last seen and location	Context before action
3 Contain	Lock and optionally revoke access	Least destructive first
4 Escalate	Wipe if sensitive data is at risk	Explicit impact + confirmation
5 Track	Show action delivery	System feedback
6 Audit	Actor, timestamp and reason	Traceability
7 Recover	Mark recovered / retire / re-enroll	Clear lifecycle state

Safety pattern: visually separate “Wipe” from routine actions and require explicit confirmation.

14 · Dashboard UX

KPI layer Managed devices, compliant devices, pending enrollments and security alerts.	Prioritization Critical alerts and non-compliant devices above secondary analytics.
Drill-down Every metric leads to a filtered list or relevant detail view.	Analytics Compliance trend, platform distribution, enrollment funnel and policy performance.
Activity Chronological events with actor, object, outcome and timestamp.	

Dashboard rule: status → cause → action. A number without a next step creates monitoring, not management.

15 · Accessibility

Area	Design direction
Color	Never rely on color alone; pair status with text/icons and maintain strong contrast.
Keyboard	Logical tab order, visible focus and keyboard-operable controls.
Typography	Readable body sizes, clear hierarchy and limited all-caps.
Forms	Persistent labels, inline validation and descriptive errors.
Tables	Clear headers, focus states and meaningful status text.
Maps	Provide a non-map alternative for geofence data.
Motion	Respect reduced-motion preferences.

16 · Usability

Efficiency Saved filters, bulk actions and keyboard-friendly tables.	Learnability Consistent terminology and guided builders.
Error prevention Preview scope, detect conflicts and confirm destructive actions.	Recovery Retry failed operations and preserve input.
Feedback Immediate state changes and background progress.	Trust Audit history, actor, timestamp and scope.

17 · UX Metrics

Metric	What it measures	Illustrative target
Enrollment completion	Successful enrollment	+15%
Time to enroll	Invitation to compliant device	-30%
Task success	Core admin tasks without help	>90%
Time to remediate	Alert to compliant state	-25%
Policy error rate	Failed / conflicting deployments	-20%
Remote action delivery	Lock / wipe delivery	>98%
Support contacts	Enrollment/device tickets	-15%
Accessibility defects	Critical issues pre-release	0 critical

Use usability tests, analytics, support-ticket analysis and moderated administrator interviews. Establish a baseline before setting final targets.

18 · Enterprise UI Design Direction

Visual style Modern enterprise SaaS: restrained, professional, trustworthy and data-dense.	Layout Persistent left navigation, top context bar, breadcrumbs, tabs and strong grid.
Components Tables, filters, cards, drawers, modals, badges, timelines, charts, maps and toasts.	Color semantics Blue primary; green healthy; amber warning; red critical; neutral structural surfaces.
Density Compact but readable tables, clear grouping and progressive disclosure.	Responsive Desktop-first with tablet adaptation for monitoring and review.
Design tokens Consistent spacing, radius, typography, elevation, borders and semantic states.	

19 · Portfolio Case-Study Structure

#	Chapter	Evidence
1	Hero	Product statement, role and scope
2	Problem	Business and user problem
3	Context	Stakeholders, constraints and assumptions
4	Research	Methods, findings and evidence
5	Personas	Admin and employee needs
6	Empathy map	Admin mindset and pain points
7	IA	Structure of the complex domain
8	Journey	End-to-end experience
9	Flows	User and task flows
10	Wireframes	Key decisions and iterations
11	Visual system	Enterprise UI direction
12	Final UI	Dashboard + key modules
13	Security	Lost/stolen device flow
14	Validation	Usability and accessibility
15	Metrics	Success criteria and measured outcomes
16	Reflection	Trade-offs, learnings and next steps

Final case-study narrative

The strongest story is not a collection of screens. It is a system: administrators observe risk, understand the cause, choose a controlled action, verify the result and leave an auditable trail. Employees receive a simpler enrollment experience while the organization gains scalable security and visibility.
